

AUTOMOTIVE  
GRADE LINUX

VERY GOOD VENTURES

# One codebase, every screen

Architecting multi-display Flutter experiences across automotive.

May 2026 - Jorge Coca, Head of Engineering

# VERY GOOD VENTURES

VERY GOOD VENTURES

# Why frontend is so fragmented in the vehicle industry?

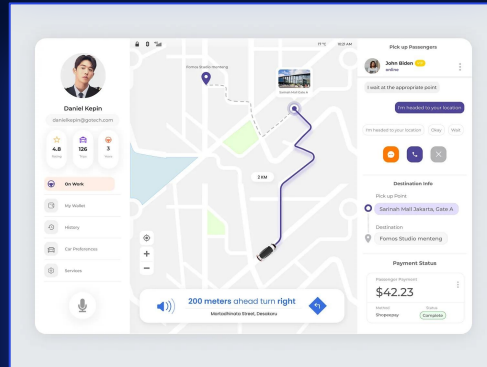

# The car is already a multi screen device.

INSTRUMENT CLUSTER

IN-VEHICLE INFOTAINMENT

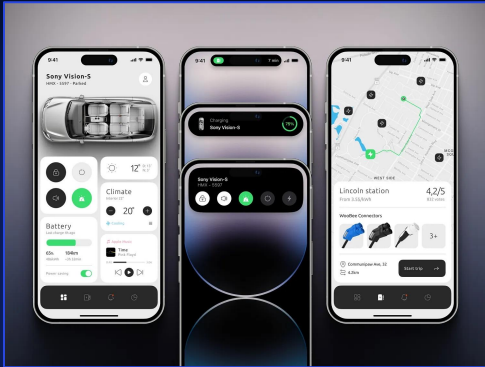

REAR DASHBOARD

HEADS-UP DISPLAY

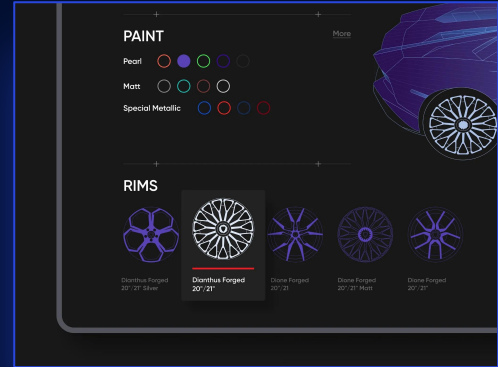

# Outside the car, the industry is also multi screen

MOBILE APPS

EXPERIMENTS & SMART DEVICES

WEB CAR CONFIGURATOR

**... and many more!**

THE COST

# The industry is paying for multi-screen multiple times

## What the customer sees

- Cluster looks 2015. IVI looks 2025.  
Brand drift across surfaces.
- Companion app feels like a different product entirely.
- Dealer kiosk and service tablet share nothing with the vehicle.
- Innovation ships unevenly. One surface at a time.

## What it costs the OEM

- 7+ surfaces. 7+ stacks. 7+ teams. 7+ release cycles.
- Same vehicle state model, reimplement 7 times.
- Same brand tokens, redrawn 7 times.
- Every change ships 7 times (or doesn't)

# Flutter. This is the way!

# Flutter is an open source framework by Google for building beautiful, natively compiled, multi-platform apps from a single codebase.

## Multiplatform

**Only true multi-platform solution.**

An efficient developer experience, scalable approach to testing and automation, and a platform portable codebase makes developers vastly more productive than developing with native tools.

## Fast

**Compiles natively to machine code**, which enables fast app performance and high frame rates.

Unlike other frameworks that use a bridge and native components, Flutter's architecture guarantees the **highest performance possible** on every platform.

## Productive

**Development tooling is vast and extremely high quality**, which improves velocity and efficiency.

Features like **Hot Reload**, VS Code extensions, and a robust, high quality community ecosystem enable Flutter developers to be extremely productive.

## Scalable

**Control over every pixel and modularity makes it easy to manage and scale.**

Flutter gives developers complete control over the user experience, while also providing helpful tools to accelerate UI development. The ability to seamlessly build and maintain design systems across touchpoints accelerates velocity while maintaining quality.

# How do we make it happen?

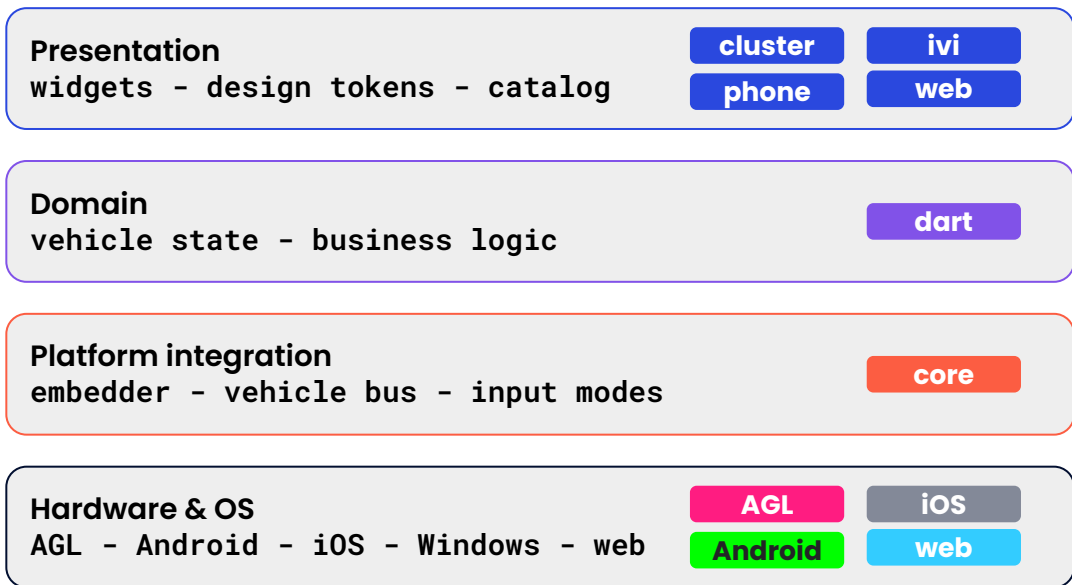

THE MENTAL MODEL

~~Write once, run everywhere.~~

**Share the layers that  
should be shared.  
Isolate the layers that  
should not.**

## THE ARCHITECTURE MAP

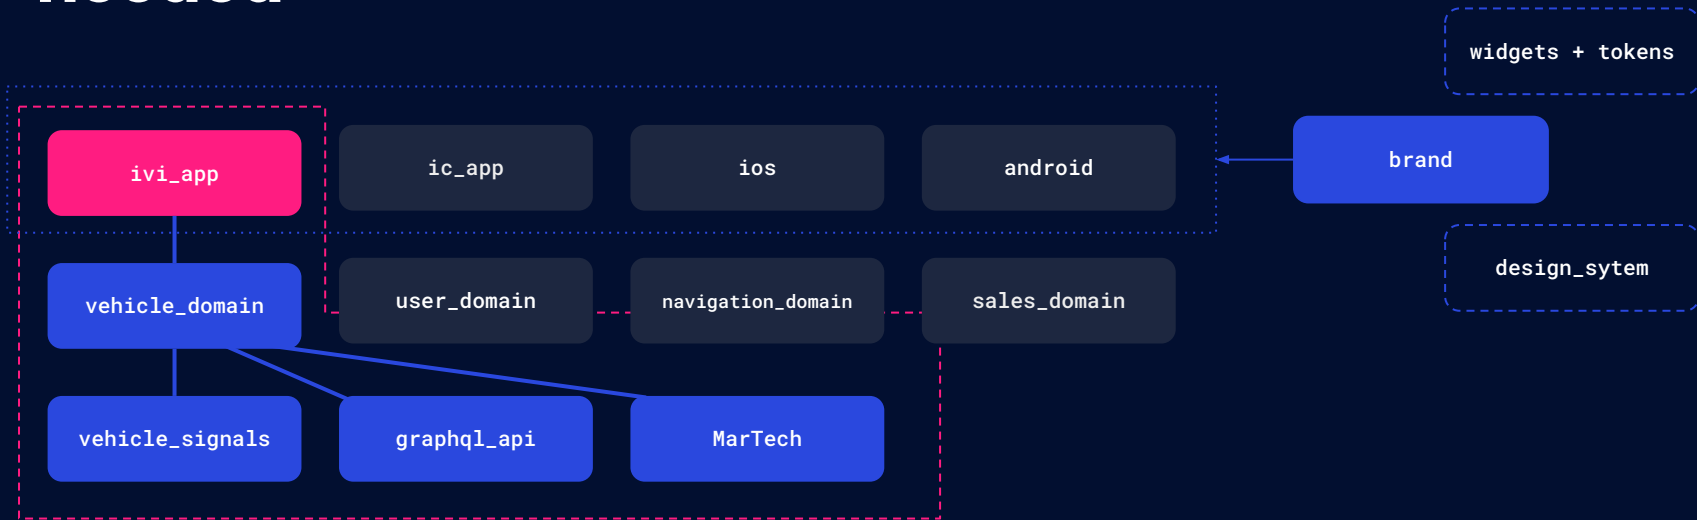

# Four layers. Different sharing contracts.

## Reading the stack

Presentation is shared at the widget/molecule and component level. Platform mostly diverges, but can be shared (eg. authentication) Hardware is whatever the surface runs on.

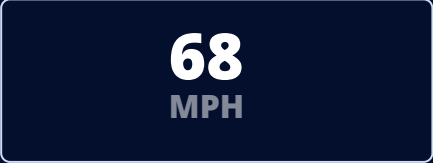

# Multiple apps. Share code when, and where needed

For any platform, you compose your application as if it was a puzzle. You can either share and re-use models and modules, or create your own when needed

# Same widget. Different tokens.

IVI

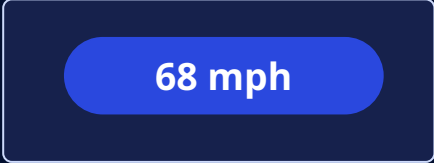

Size: md  
Contrast: brand  
Interaction: touch + rotary

CLUSTER

Size: xl  
Contrast: high  
Interaction: none

PHONE

Size: sm  
Contrast: subtle  
Interaction: touch

One widget. Three tokens. Three behaviors. Zero per-surface branches in the widget consumption itself. Brand sits on top as the last token later, and the system carries it.

speedometer.dart

```
class Speedometer extends StatelessWidget {  
  const Speedometer({  
    required this.speed,  
    required this.units,  
    super.key,  
  });  
  
  final int speed;  
  final String units;  
  
  @override  
  Widget build(BuildContext context) {  
    switch (context.platorm) {  
      case .iOS, .android:  
        return _MobileSpeedometer(speed, units);  
      case .agl:  
        return _AglSpeedometer(speed, units);  
      default:  
        throw NotImplementedException();  
    }  
  }  
}
```

# One source of truth. No surface talks to another surface.

Surfaces subscribe to typed state streams

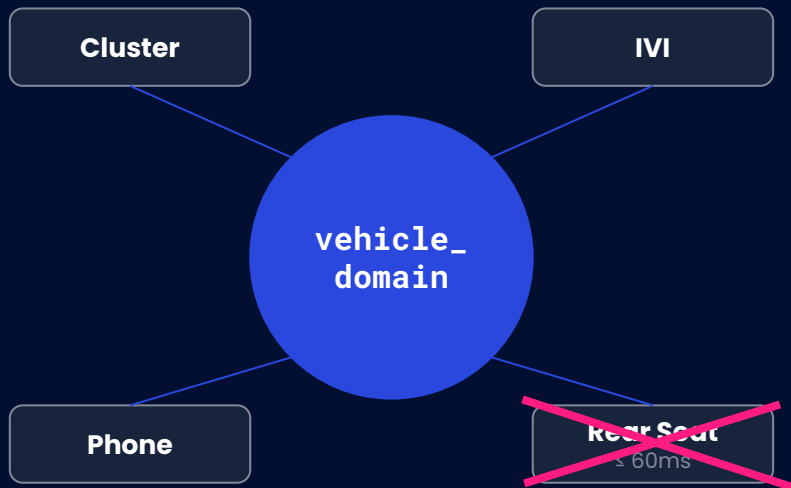

Each subscription can have its own latency budget

No cross-surface API. No direct calls.

Add a field to the model – every subscriber sees it on the next emission. No coordination required.

All written in Dart. Zero UI. Fast compilation. One source of truth that every surface reads from it.

# Surfaces fail. The system keeps working.

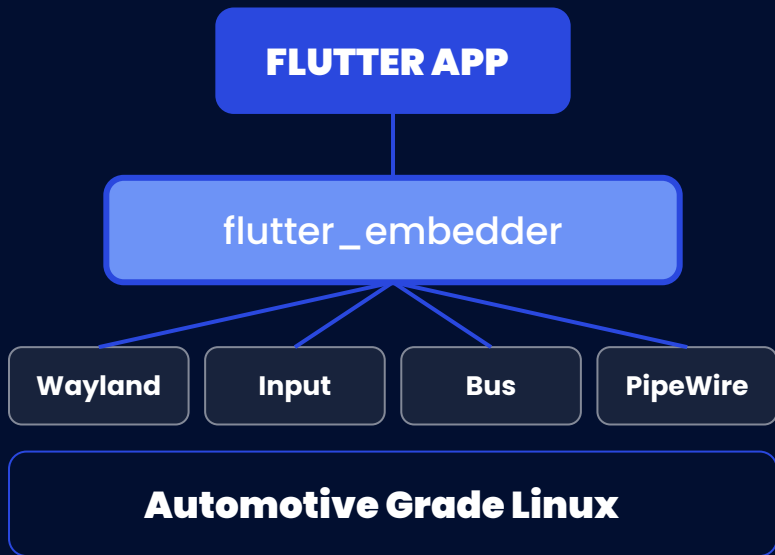

Cluster reboots. IVI keeps working.

Phone disconnects. Head unit unaffected.

Rear seat asleep. No errors propagate.

Surface comes back → resubscribes, catches up. No reconciliation protocol → there's nothing to reconcile.

# Platform integration. Where Flutter meets AGL.

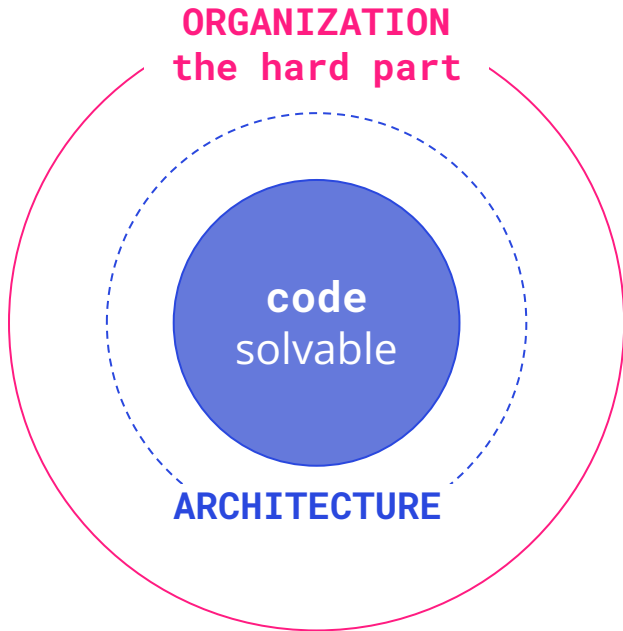

**Inputs normalized.** Touch, rotary, voice, hard keys arrive as a typed event stream. Widgets don't know which.

**Vehicle signals abstracted.** CAN, SOME-IP, VSS — all surfaced as typed Dart streams. Sim signals on the Pi today.

**Contained.** Differences live here so they can't leak upward.

**Is it that easy? Where's  
the trick?**

# The hardest layer. Organizations do not have compilers.

Shared code requires shared planning. Product, design, engineering across surfaces.

The architecture exposes the org chart (Conway's Law)

The technology works. The organization is the hard part. Naming this protects you from concluding that *Flutter didn't work* when really the org didn't.

# AGL developer experience isn't at mobile parity yet.

## MOBILE FLUTTER TODAY

- Hot reload in milliseconds
- Instant deploy to devices
- Mature embedder, large community
- Worked examples for everything

## FLUTTER ON AGL TODAY

- Hot reload is not easy to replicate
- Manual or scripted deploy to head unit
- Embedder coverage is improving but uneven
- Smaller community

**Eliminating friction** out of the development process sparks creativity, standardizes the process, and invites contributors from all backgrounds to bring their ideas forward.

# The investment is frontloaded.

With two or more, this is the cheaper option – and the more surfaces you add, the further it pulls ahead.

# The same architecture is your entire digital stack.

# Ship faster. Higher quality. Lower cost. Innovate more.

## Ship faster

“One team”. One design system. Shared roadmaps. New surfaces in sprints, not quarters or years.

## Higher quality

Shared domain means surfaces can't drift. State is consistent by foundation.

## Lower cost

High % of reusability. New surfaces are dramatically cheaper than the first one.

## Innovate more

GenUI on day one, not quarters. Ready for the next interaction model on every surface at once.

These aren't promises. They're direct consequences of the architectural decisions covered in this talk.

# How does it look in practice?

# Success! Flutter enables a single front-end technology across our digital stack

## Multiplatform by design

Code is portable across operating systems. Siloed knowledge no longer needed.

## Highest level of performance

60/120 fps at your fingertips, even on low-end HW. Native compilation. Small binaries.

## Innovate. Experiment. Scale.

Significant reduction of time to market, even with the most original and imaginative use cases.

## Smart ROI. Invest where your value is

These aren't promises. They're direct consequences of the architectural decisions covered in this talk.

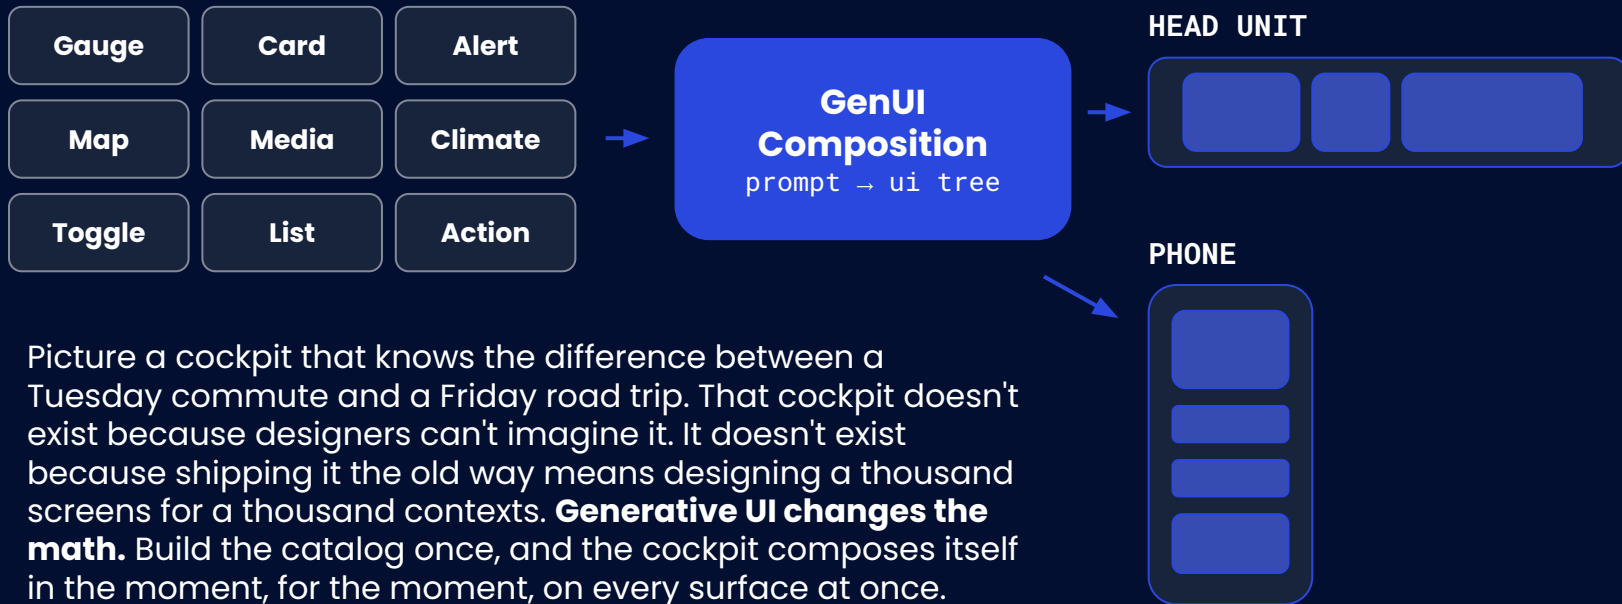

One more  
thing...

**This would not  
be a tech talk if  
we don't talk  
about AI...**

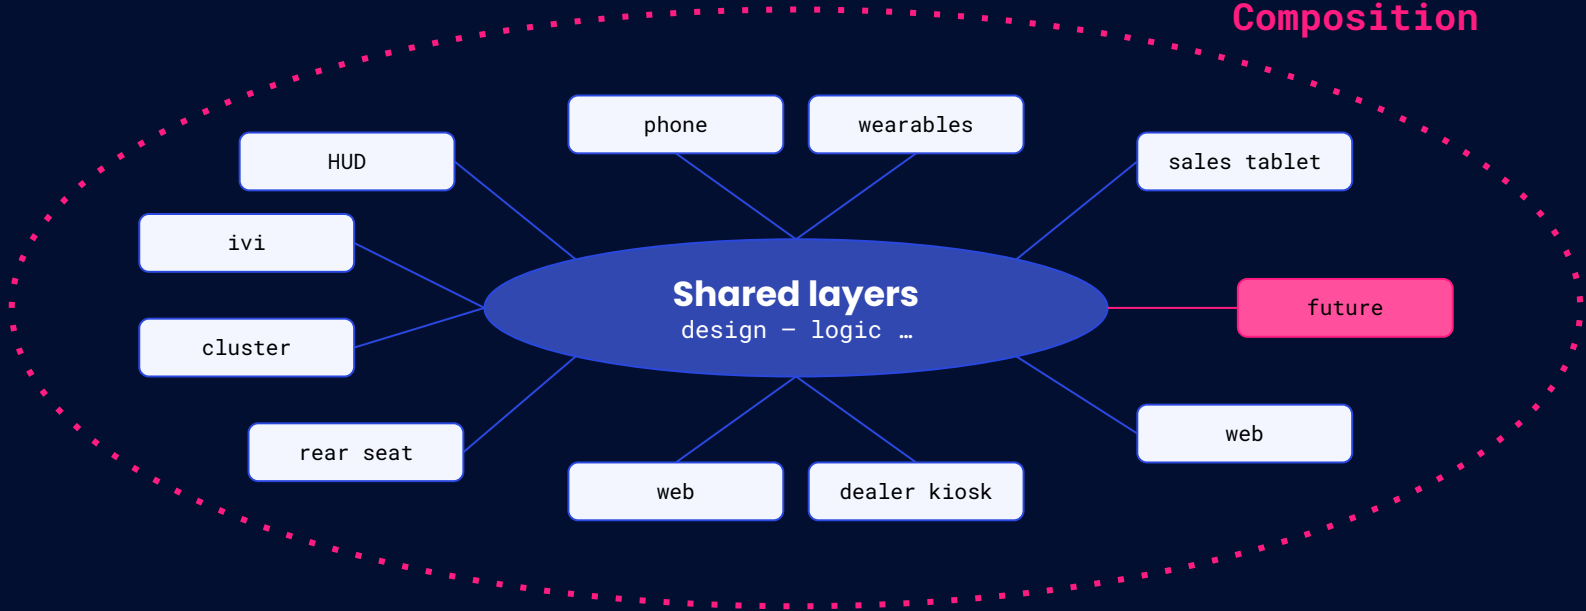

# The widget catalog is also the GenUI catalog. AI draws the UI based on context and intent.

Picture a cockpit that knows the difference between a Tuesday commute and a Friday road trip. That cockpit doesn't exist because designers can't imagine it. It doesn't exist because shipping it the old way means designing a thousand screens for a thousand contexts. **Generative UI changes the math.** Build the catalog once, and the cockpit composes itself in the moment, for the moment, on every surface at once.

# The same architecture is your entire **INNOVATION** digital stack.

GenUI / AI  
Composition

WHY WE CAME TO TOKYO

**AGL is the most serious open automotive platform in the industry.**

**Flutter is the most productive UI toolkit for multi-surface products.**

The combination is underused, and we are here because we want to help change that.

**We are investing in AGL.**

We want to work with the people in this room who are trying to raise the UI/UX ceiling of their vehicles.

Thank you

**We're excited to  
connect with you.**
