

We Didn't Replace Our Team With Agents.

We Made Them Unstoppable.

Jake Pineda - Head of Membership Development

Agentic AI
Foundation

The Fear Is Real. But It's the Wrong Fear.

The narrative: "AI will just do our jobs"

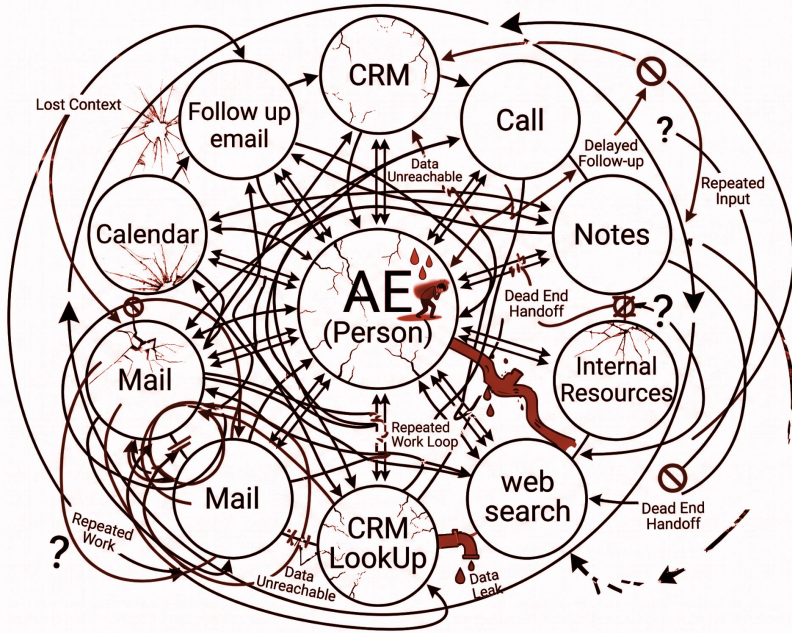

Reality: Teams measure AI usage. Zero productivity gains.

The trap: Humans become optional or trapped in proprietary silos.

We chose amplification over replacement

And we built it on open protocols. No vendor lock-in by design.

Before: Manual, Fragmented, Slow

Every member interaction:

Calendar → LinkedIn → Web search → Call → Notes → CRM → Follow-up email.

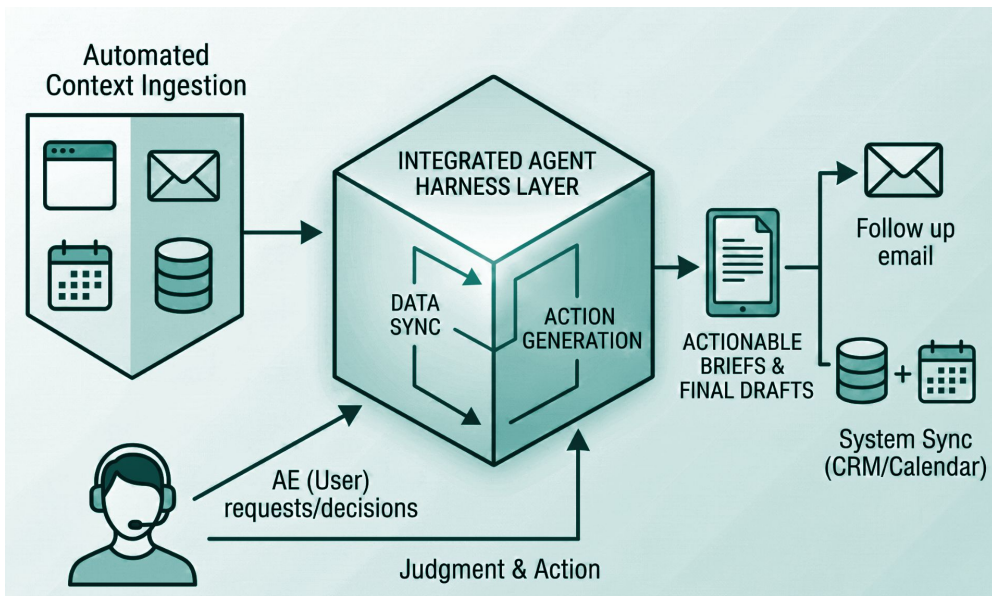

Data fragmented across tools paid for but can't control. No unified view, no portability, requiring 1-2 hours of prep and cleanup.

Every vendor owns their slice. You can't connect the picture without rebuilding it manually every time.

Information gaps. Delayed follow-ups. Members noticed.

No persistent context because no single system had the full picture. Insights evaporated after the call.

Enter: A Unified Agent System

Fragmented tools → MCP as the connective layer. One open protocol pulling calendar, CRM, email, and research into a unified feed you own via AI Agents

Manual research → Scheduled Agent prepares automated brief. Ready when you walk in.

Lost context → Persistent memory built on your data, in your format, under your control. Every interaction starts with the full picture.

Delayed follow-ups → Drafts within 30 minutes of call end.

What Actually Changed

Call prep: 1-2 hours → 15 minutes (agent brief ready when you need it)

Follow-up speed: Next day → 30 minutes (drafts auto-generate)

Member onboarding: Inconsistent gaps → Repeatable, every time

Renewal forecasting: Last-minute scrambles → Weeks of advance warning

Deal cycles: Fragmented, slow → Faster, consistent, no drops.

Still Working On

Hallucination: Agents fabricate details on cost, initiatives. Human review non-negotiable. Model selection alleviates this.

Memory management: Context increases power but also size. Maintain signal while staying lean.

Trust calibration: Teams learn when to trust the brief and when to dig deeper.

This is ongoing calibration.

Teams upskill faster

Agents Handle the Work.

You Handle the Relationships.
